Very much so. Plone automatically encourages search engine optimization best practices such as keyword-rich URLs, human-readable descriptions, and crawlable sitemaps. Many sites that switch to Plone immediately notice a jump in their search engine rankings, crawl quality and relevance.

As an example, plone.org is one of the few websites in the world that has a 9 out of 10 PageRank in Google, the same as major sites like those of IBM and Microsoft.

6 What do I need to host my Plone site?

Plone can run on Linux, Windows, Mac OS X, FreeBSD and Solaris — and offers a straightforward installation process to get a website up and running in no time.

14 Is Plone secure?

Plone offers superior security without sacrificing power or extensibility.

As an open source product, a large number of developers frequently scrutinize the code for any potential security issues. This proactive approach is better than the wait-and-see approach in proprietary software that relies on keeping security issues a secret instead of resolving them outright.

Built on Python and Zope, which are highly secure platforms, Plone has a technological edge that has helped it attain the best security track record of any major CMS (Source: CVE).

And because of its object-oriented backend, Plone isn't vulnerable to SQL Injection attacks, which are one of the most common security problems that affect PHP/MySQL-based systems. Plone's flexible ACL system for user permissions also helps ensures that users only see the content that they're supposed to.

In fact, security is a major reason why many CMS users are switching to Plone.

Plone is a true CMS with built-in publication workflow and document management features, unlike other systems such as Sharepoint or Alfresco, which are primarily document management systems with limited web functionality. This makes Plone ideal for intranets and extranets.

Plone can be customized and extended to meet the specific needs of an organization in terms of site structure, content types, workflow rules, etc. Not all CMSes offer the same level of flexibility.

Because it is built on top of Python and Zope, Plone is very secure, which is a reason why many switch from Joomla and Drupal to Plone.
